

Prompt Scoring & Quality Optimizer
Built by: Podamala Yelsi
Type: AI-assisted functional prototype

Why I built it

I noticed that improving prompts is often trial and error. I wanted to explore whether a tool could guide users through small, step-by-step improvements instead of simply generating a new prompt.

What I built

A simple web prototype where users can:

- Enter and analyse a prompt.
- Get a starting quality score.
- Select improvement suggestions such as clarity, context and structure.
- Re-analyse the prompt after each improvement.
- See the updated prompt and score.

My role

I came up with the concept, workflow and improvement logic. I used AI-assisted development to turn the idea into a functional prototype and iterated on it while testing the user flow.

What I learned

The main learning was that building a working interaction involves more than the UI. I had to think about scoring, multiple improvement steps, prompt updates and handling edge cases.

Current status

This is an early functional prototype, not a production product. My next step would be to test it with real users and understand whether the scoring and suggestions actually help people write better prompts.
